RealTechNews

We're noticing a growing trend here at RealTechNews where **the computer is slowly being pulled out of the equation** or at least made optional when it comes to communication between various devices. Digital cameras can print without touching a PC, this past week, we covered the [SD card to SD card copier](#), and today, the FlashPoint ShareDrive allows you to share files between USB devices without a PC.

Xmultiple's ShareDrive line of USB flash memory pen drives and can easily download and upload data files between a ShareDrive pen drive and any other USB Memory pen drive **or any other USB memory peripheral such as computers and MP3 players**. ShareDrives are small, lightweight devices and are powered by a rechargeable lithium-ion battery and are available in 128k, 256k, 512k, 1GB and 2GB sizes.

- Share business files at lunch, while traveling or at meetings
- Transfer Mapping Software to your Vehicle
- Exchange or transfer data from one cell phone to another
- Download digital photos from your camera or most any USB equipped peripheral
- Swap MP3 music or photo files with friends at school, around town or at the office
- Teachers and Students - Exchange Class Lectures, assignments, research, etc. -
- Exchange business card, Catalogs or product sheets at trade shows electronically
- Make back-ups of other pen drive files or USB equipped peripherals.

We say: It's a drag you have to charge it, but the concept is definitely heading the right direction, and at \$115 for 512MBs, the premium over regular thumb drives is not too steep for the added functionality. i guess that means my MP3 player has grown up and is ready to **mate with other objects**.....[More info Here](#). *Soure: [Sharedrives.com](#)*
